Created with a sketch. 6.936 Each website requires an admin panel. Unfortunately, unlike Django, Laravel doesn't include a built-in admin panel, but there are many other options. In this tutorial, we will use Voyager as an example. This is a free admin panel designed for Laravel apps. Visit Voyager's official website. Install Voyager First, include the Voyager package using the composer: the composer needs a tcg/voyager Install Voyager: php artisan voyager: the installation of migration files created in the previous section will also be rescheduled if you have not already done so. Installation is complete. Now we need to create a new admin user: php artisan voyager:admin your@email.com --create Follow the instructions and hang up your username and password. Before we can access the Voyager admin panel, we need to make small changes to our Apache server, as Voyager requires 8,000 port. Open the configuration file and make these changes. Then restart the Apache server. Go to in email and the password you just created, Set up And Now, there's an easy way to work with database tables. Go to tools and add BREAD to the database tables created in previous sections. (not including post_tag) Edit BREAD for The Type of Input Change categories to describe on the text area. Be sure to save the changes before you continue. We also have to add a relationship to Voyager, as we have developed, each category has many messages: Edit BREAD for tags Add relationships: Edit BREAD for the message Add attitude: Edit BREAD for users We only need to add another attitude for users and messages: Now, you should be able to see the menu for Category, Tags and Messages. Possible image problems are not downloading the edited .env file. Changing APP_URL on when editing messages Change the URL Slug for messages to something other than messages. Then go to the Builder menu (if it already works for you, then there is no need to change the menu): Click on the Builder, and edit the menu for posts Next post: Laravel Tutorial #6: Routes and Controllers Related Articles How to Make Your Server a Safer Laravel Tutorial for Beginners Django Tutorial for Beginners I Want to Translate My Blog Pattern, which was created in Voyager. When I add a new post I write it in only one language. Can you tell me step by step how to add a translation to my posts? I want the post-translation to be changed from the Voyager admin panel, not from the file. How can I do that? This Laravel/Voyager Frontend is designed to enable developers to easily design page blocks so that Voyager users can create stunning Page. Built by Pivotal. Preconditions Composer Set Laravel Set Voyager Set Voyager Frontend Installation No. 1. Require this package in your fresh Laravel/Voyager composer project to require pvtl/voyager-page-blocks No. 2. You'll run the installer php artisan-travel-page-blocks: set install (Optional) Seed database with an example of page blocks. php artisan-page-page-blocks: Seed Creation and Change Blocks Page Blocks are created and configured in 2 steps: Identify the block - in /config/page-blocks.php Build an HTML layout block - create a template in/resources/views/provider/traveler-page-blocks/blocks 1. Identify the block Check out /config/page-blocks.php. Here you will determine each block - you will tell him what margins the unit should have (for the administrator to manage) and what Blade template it should use on the interface. Each array inside this configuration file is a block of pages Each block contains a field Each box contains a unique field key Each field based on the Voyager Data Type Below table explains what each property does and how it relates to the block itself: The key goal of the Root Key is the name of your page block, used to download the configuration title This is the name of the display of your block page, used in the block box 'Adder' This is where your field block pages live (text areas Images display_name, etc.) fields No. , adds a placeholder on the field (not available for all partial) fields No. Create HTML When you're ready to start structuring your block display, you'll need to create (or override our defaults) blade pattern (located at/resources/views/supplier/voyager-page-blocks/blocks/your_block.blade.php) and use the accessories you identified in your module configuration file to get data about each field (\$blockData-image_content!!). Example. Let's say we want to create a new block with the editor of 1 WYSIWYG called Company Review. Step 1. Identify the new In/config/page-blocks.php block, we'll add: \$blocks'company_overview' - name 'company review', 'template' no 'zgt; 'voyager-page-blocks::blocks.company_overview', 'fields', No qgt; 'content', 'field', 'field', 'content', 'display_name': 'Company review content', 'type' 'rich_text_box', 'requires' No'gt;1, 'filler' "gt; '1t; Step 2. Create HTML In/resources/views/vendor/voyager-page-blocks/blocks, we'll create a new file called company_overview.blade.php with: zlt'div class-page-block'gt;div class-grid-container column text-center'gt; ! \$blockData--'gt;content!' Step 3. Add a block to the Page Next, go to the Voyager Administrator's pages and click the Content next to the page. Now you'll be able to select a company review from Block's section. Add a block to the page, drag/throw it in place, edit the text, etc. Developer Controller Blocks you can also incorporate custom logic and functionality into your page blocks. This can be done with the developer controller block - just point your way to the namespace'd controller and the method you want to call that should return the view and you'll be on your way. For example, the Voyager Frontend package comes with a recent Posts method/view that you can play and browse with. From add Page Block to The Administrator, add a developer-type controller type unit, and then enter the following in the path box: Pvtl-VoyagerFrontend\Http\Controllers::recentBlogPosts (2) This will result in the release of 2 blog posts on the interface. You can change the first method parameter to 6 to give out 6 blog posts. Simple. Troubleshooting It is important to disinfect the output of the field, zero values will cause errors. It's important that you follow a naming pattern that's configured in the sample page blocks because the keys refer to other cogs in the system to stitch the blocks together. The resource/view catalog and configuration file already set up examples of blocks to get started. Voyager is a Laravel Administrator package that includes BREAD (CRUD) operations, media manager, menu builder, and more. See Github Ahoy Matey and Welcome aboard!
